

ABSTRACT OF THE DISCLOSURE

The present invention provides a cooling device having improved cooling performance and providing higher flexibility, an electronic apparatus and an acoustic apparatus employing the cooling device, and a method for producing the cooling device. The cooling device is provided with an evaporator that is capable of cooling an object to be cooled, and a condenser that is capable of releasing to the outside heat that has been absorbed during the cooling by the evaporator. A vapor-phase conduit and a liquid-phase conduit, both of which are made of fluorocarbon resin and through which an operating medium flows, are disposed between and coupled to the evaporator and the condenser, thereby circulating the operating medium.
